PromptForge

Quick Start Guide — How to build better prompts in minutes

WHAT IS PROMPTFORGE?

PromptForge walks you through nine simple questions about what you need from an AI. It assembles your answers into a clear, structured prompt that gets significantly better results than a vague, off-the-cuff request. Think of it as a form that builds expert-level prompts for you.

HOW TO USE IT

1. Visit adamreflects.vercel.app/promptforge
2. Answer 9 optional questions — you can skip any you like
3. PromptForge builds your prompt and scores it (0-100)
4. See improvement suggestions with point values
5. Test the prompt live through Claude right in the tool
6. Copy and use anywhere — no account needed

THE 9-STEP FLOW

You move through these steps one at a time. Each shapes a different part of the final prompt. You can skip any step — PromptForge handles blanks intelligently.

STEP	WHAT IT DOES
Goal	What you want the AI to do — the foundation of everything.
Audience	Who the output is for — shapes language and depth.
Tone & Style	How the answer should sound (friendly, direct, authoritative, etc.).
Format	Structure of the answer (paragraphs, bullets, table, code, etc.).
Length	How long the response should be.
What to Avoid	What the AI should NOT do — often the most important step.
Example	Paste a sample of the kind of output you want.
Approach	How factual vs creative the response should be.
Context	Background info, brand voice, constraints, power-ups.

The big idea: Every step is optional. Skip what you don't need — PromptForge fills gaps with smart defaults or simply leaves them out. A quick, specific prompt beats a perfect one you never finish.

PromptForge

PAGE 2 — BLANKS, SCORE & POWER-UPS

WHAT HAPPENS IF YOU LEAVE A STEP BLANK?

PromptForge is designed so you never get stuck. When you skip a question, one of two things happens:

- **Smart defaults:** PromptForge reads your goal and assigns an expert role automatically. If you write "write a cold outreach email for my SaaS product" but skip the role, it assigns "expert sales and communications strategist" — not a vague fallback.
- **Omit the section:** If you skip Tone, the prompt won't include tone instructions and the AI uses its own judgment. The prompt still works — just with fewer constraints.

QUALITY SCORE (0-100)

After you generate your prompt, you get a score with a colour gauge (red = weak, orange = decent, green = strong). Below it sit specific suggestions — each tells you exactly what to add and how many points it's worth. Tap any suggestion to jump to that section and edit.

What moves the needle most? Pasting an example of good output is worth +16 points. Examples give Claude a quality benchmark to aim for. A score of 65 is solid. A 45 still works. The suggestions tell you which additions matter most.

POWER-UPS (ONE-CLICK BOOSTERS)

Found on the Context step. One-click toggles that add proven prompting techniques. All start off. Pick any that fit:

Ask me questions first

AI asks clarifying questions before starting — gets you a tailored answer

Think step by step

AI reasons methodically instead of jumping to conclusions

Critique & improve

AI reviews its own draft, finds weaknesses, delivers an improved version

Give me options

AI provides 2-3 alternatives with trade-offs so you can choose

Flag uncertainty

AI calls out anything it's not sure about, so you know what to verify

Make it actionable

AI ends with concrete steps you can take immediately

PromptForge

PAGE 3 — TESTING & ADVANCED MODE

TEST & REFINE

Hit "Test This Prompt" to run your prompt through Claude right there and see the output. The tool calls Claude directly — you see the response in real-time.

If it's not quite right, use the inline editors to tweak any section, then hit Regenerate. No need to start over — refine until it works.

SUPER USER MODE

The standard nine-step flow works great for 90% of use cases. But if you need to fine-tune further, unlock Super User mode to add:

- **Custom AI role** — "a senior UX strategist with 20 years in fintech" instead of auto-inferred
- **Domain** — specify your exact field for hyper-relevant reasoning
- **Reasoning style** — "chain-of-thought", "argue both sides then give a verdict", etc.
- **Success criteria** — define what "good" looks like for this task
- **Hard constraints** — budget caps, word limits, technical requirements
- **Output requirements** — "start with an executive summary", "include a comparison table"
- **Iteration instructions** — "draft, then review as a harsh editor and improve"

It's hidden by default because most people don't need it. But power users can unlock it to squeeze every last point out of their prompts.

Ready? Visit adamreflects.vercel.app/promptforge and start building prompts that get results. No account needed. Free.
